Unified Upload Studio

The photographer's ingestion workspace. Inherits the Hub shell from V6 09 exactly — Stormeaser, 240px left rail, fluid main content, SiteFooter — and the Portfolio Wall's visual vocabulary from V6 10. This is not an admin media library: photographers, metadata is contextual, administration is invisible until asked for.

One workflow, any quantity. A single photograph and a batch of two hundred pass through the same Upload Drop zone → Queue → Metadata → Publication path. There is no separate "simple upload" mode — the workflow simply has one less to do.

Design reference only — no implementation, no tokens, no CSS. The Hub shell is out-redesigned here; this pass strengthens annotations, lifecycle, component tree, and specification only.

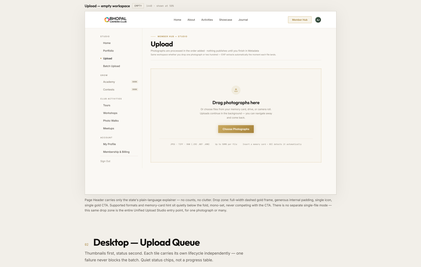
Inherited	Foundation	Hub pattern
Identical to V6 09 — 240px rail · fluid main	**Empty → Queue → Metadata → Publication**	**Right-edge overlay — metadata, not admin**

Edit	Bulk CTA
Automatic on upload — never blocks	**One only per state — never two competing actions**

01. Desktop — Empty Upload Workspace

A single editorial drop zone — no toolbar, no queue chrome, no clutter. One gold CTA. The frame reads like an empty light table waiting for film, not a form waiting to be filled.

Upload — empty workspace · EMPTY · 1440 · shown at 100

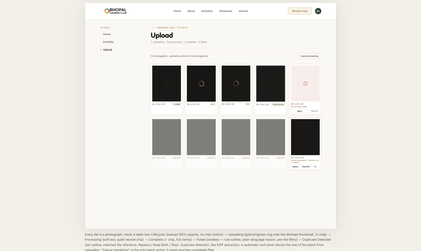


Page Header carries only the state's plain-language explainer — no counts, no clutter. Drop zone: full width dashed gold frame, generous internal padding, single icon, single gold CTA. Supported formats and memory-card limit sit quietly below the fold, mono-set, never competing with the CTA. There is no separate empty-file mode — this same drop zone is the entire Unified Upload Studio entry point, for one photograph or many.

02. Desktop — Upload Queue

Thumbnails first. Status second. Each tile carries its own lifecycle independently — one failure never blocks the batch. Quiet status chips, not a progress table.

Upload — 12 photographs queued · UPLOADING · 1440 · shown at 100

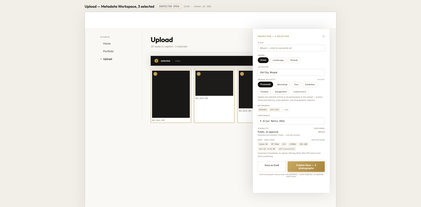


Every tile is a photograph, never a table row. Lifecycle: Queued (55% opacity, no chip motion) → Uploading (gold progress ring over the dimmed thumbnail, % chip) → Uploaded (full opacity, quiet "Uploaded" chip) → Failed (terracotta border, "Retry" + "Remove") → Published (gold "Published" chip, no further actions). Cancel remaining is the only batch action; it never touches completed files. Failure is isolated — one failed tile, retried or removed, leaves the rest of the batch untouched. Drop more photographs to add them to the queue. Cancel remaining. 12 photographs · uploads continue in the background. Golden Hour, Kaziranga · Uploading · 64% · Cancel. Misty Ghats, Varanasi · Uploading · 31% · Cancel. Temple Steps, Hampi · Uploading · 88% · Cancel. Fort Ridge, Jaisalmer · Uploading · 12% · Cancel. Monsoon Tea, Munnar · Queued · Remove. Harbour Lights, Kochi · Queued · Remove. Backwaters, Alleppey · Queued · Remove. Spice Market, Kochi · Queued · Remove. Coastal Road, Goa · Queued · Remove. Old Quarter, Pondicherry · Queued · Remove. Lighthouse, Gokarna · Queued · Remove. Rice Terraces, Ubud · Queued · Remove. Sunset Pier, Mumbai · Queued · Remove. Cancel remaining. Uploading. Uploaded. Failed. Published. Retry. Remove. Drop more photographs to add them to the queue. Cancel remaining. Golden Hour, Kaziranga. Misty Ghats, Varanasi. Temple Steps, Hampi. Fort Ridge, Jaisalmer. Monsoon Tea, Munnar. Harbour Lights, Kochi. Backwaters, Alleppey. Spice Market, Kochi. Coastal Road, Goa. Old Quarter, Pondicherry. Lighthouse, Gokarna. Rice Terraces, Ubud. Sunset Pier, Mumbai.

03. Desktop — Metadata Workspace

Once uploads complete, photographs move here for captioning. Metadata lives in a contextual inspector — never a dominant form. Selecting several photographs enables bulk fields, applied only to the selected set — the rest of the batch is untouched. Any field where selected photos already differ shows "Mixed" and saves before overwriting. Visibility, Copyright, and Licensing arrive pre-filled from the member's profile defaults; the photographer may override any of them per photograph or per selection.

Upload — Metadata Workspace, 3 selected · DURATION 8PM · 2415 · shown at 100

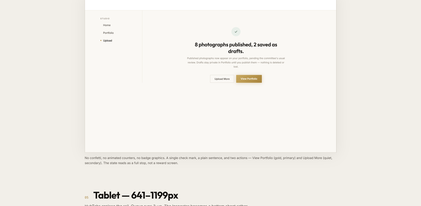


Bulk fields that already differ across the selection render as ticks "Mixed" placeholders — typing into one requires an explicit click to confirm overwrite; nothing is silently replaced, and edits apply only to the selected photographs, never the whole upload. EXIF is always shown per-photograph (from the anchor image), auto-extracted on upload, never bulk-edited, and never required. Origin Activity is optional and, when set, applies to every photograph in the upload — later powering Showcase filtering, event galleries, and photographer statistics. Visibility, Copyright, and Licensing default from Member Profile preferences and can be overridden here. Title, Caption, Description, Alerts, Keywords, Location, Copyright, Visibility, Featured, and Licensing all live here — never on the wall itself. The inspector's final action is the Publication choice — Publish Now or Save as Draft — not a generic "Apply."

04. Desktop — Upload Complete

Quiet confirmation — a count, not a celebration. Reflects whatever Publication choice was made in the Inspector: published photographs go to the portfolios for review; drafts are counted separately and stay private. Two calm actions, only one is gold.

Upload — complete · PUBLISHED · 1440 · shown at 100

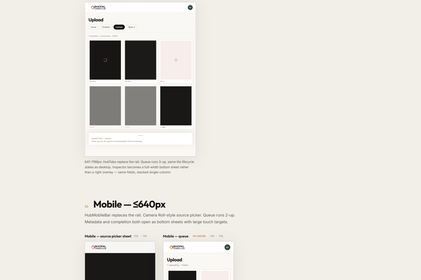


No confetti, no animated counters, no badge graphics. A single check mark, a plain sentence, and two actions — View Portfolio (gold, primary) and Upload More (quiet, secondary). The state reads as a full stop, not a reward screen.

05. Tablet — 641–1199px

HubTabs replace the rail. Queue runs 2-up. The Inspector becomes a bottom sheet rather than a right overlay.

Upload — Tablet queue · UPLOADING · 768 · shown at 100%

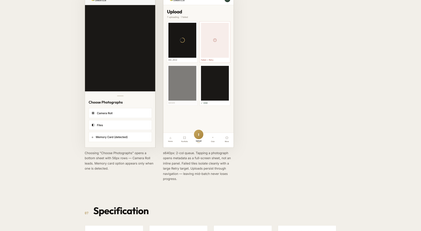


641–1199px: HubTabs replace the rail. Queue runs 2-up, same tile lifecycle states as desktop. Inspector becomes a full-width bottom sheet rather than a right overlay — same fields, stacked single-column.

06. Mobile — ≤640px

HubMobileBar replaces the rail. Camera Roll–style source picker. Queue runs 2-up. Metadata and completion both open as bottom sheets.

Mobile — source picker sheet · 375 · 750 **Mobile — queue** · UPLOADING · 390 · 750



Choosing "Choose Photographs" opens a bottom sheet with Sibyl-class — Camera Roll leads, Memory Card option appears only when one is detected.

≤640px: 2-col queue. Tapping a photograph opens Metadata as a full-screen sheet, not an inline panel. Failed tiles border clearly with a terracotta edge. Publication is a deliberate navigation — leaving mid-batch never loses progress.

07. Specification

DESIGN ANNOTATIONS

① **Drop Zone** — sole element of the empty state. Dashed gold border, 2px, 12px radius. ONE CTA, quiet format lists. Drop photographs or many — same zone, same flow.

② **Upload Queue** — grid of photograph tiles, each carrying its own lifecycle. Thumbnails first, status second. Cancel remaining and duplicate detection. No table, no rows.

③ **Selection Bar** — identical vocabulary to V6 10's Portfolio Selection Bar, repurposed for bulk. Metadata entry instead of insert ops. Applies only to the selected photographs.

④ **Inspector Panel** — right-edge overlay on desktop, bottom sheet on tablet/mobile. Bulk fields show "Mixed" when they differ. Ordinary text, dropdowns, and tag entry. Carries EXIF, profile-defaulted Visibility/Copyright/Licensing.

⑤ **Publication** — the inspector's terminal action. Publish Now or Save as Draft, not a generic "Apply."

⑥ **Complete State** — plain sentence + split count. Publish Now / Save as Draft actions, one gold. No animation, no graphics.

DESCRIPTIVE ACCESSORY

1. Photograph thumbnails (always)
2. Lifecycle chip / progress ring
3. Selection state (gold ring + check)
4. Selected-Folder / Inspector (contextual)
5. Page Header explainer
6. Left rail (wayfinding)
7. Site header (public exit)

Standalone Upload Studio screen design only — the rail + selected-folder, the Inspector, queue interactions.

```

7 + conditional

Seven always-present entry when Upload.length >= 0; Upload/Queue renders once files are added; Inspector/Panel renders only when Selection.length > 0; and all selected-item rows (queue-entry)? in Upload >>> Items[].

Data contracts

QueueFile needs {file.name, file.status, file.progress, file.error, file.exif, file.duplicateOf}. InspectorPanel needs {photo.title, caption, description, location, visibility, copyright, licensing, featured, tags, selectedIds, mixedFields}. Uploads, Metadata, and Publication are flat-file JSON/CSV/Markdown — no new models.ts/db.ts/migrations/ or new member-profile/studio/.

Automatic, non-blocking

EXIF/Creator and DuplicateDetection both run immediately per-file on upload, asynchronously. Neither can block, queue, or fail the upload itself — missing EXIF and unresolved duplicates are simply flagged for later attention.

Failure isolation

Each QueueFile owns its own retry/remove/replace/keep-both/skip; one file's state never mutates a sibling or blocks batch completion.
