V6 · STEP 8 · JULY 2026 V6 11 MEMBERS HUB UPLOAD INHERITS V6 00 · V6 91 · V6 92 · V6 09 · V6 10 RECONCILIATION PASS · NO LAYOUT CHANGE NAVIGATION INHERITED FROM V6 12

Unified Upload Studio

The photographer's ingestion workspace. Inherits the Hub shell from V6 09 exactly — SiteHeader, 240px left rail, fluid main content, SiteFooter — and the Portfolio Wall's visual vocabulary from V6 10. This is not an admin media library: photography leads, metadata is contextual, administration is invisible until asked for.

One workflow, any quantity. A single photograph and a batch of two hundred pass through the identical Drop Zone → Queue → Metadata → Publication path. There is no separate "single upload" mode — the workflow simply has one item in it.

Design reference only — no implementation, no tokens, no CSS. The Hub shell is not redesigned here; this pass strengthens annotations, lifecycle, component tree, and specification only. Navigation (rail, tabs, mobile bar) is not owned by this document — it is inherited from V6 12 Members Hub Navigation via HubLayout / HubSidebar. This pass also removes the duplicated rail markup previously sketched inline.

SHELL
Identical to V6 09 — 240px rail · fluid main

JOURNEY
Empty → Queue → Metadata → Publication

INSPECTOR
Right-edge overlay — metadata, not admin

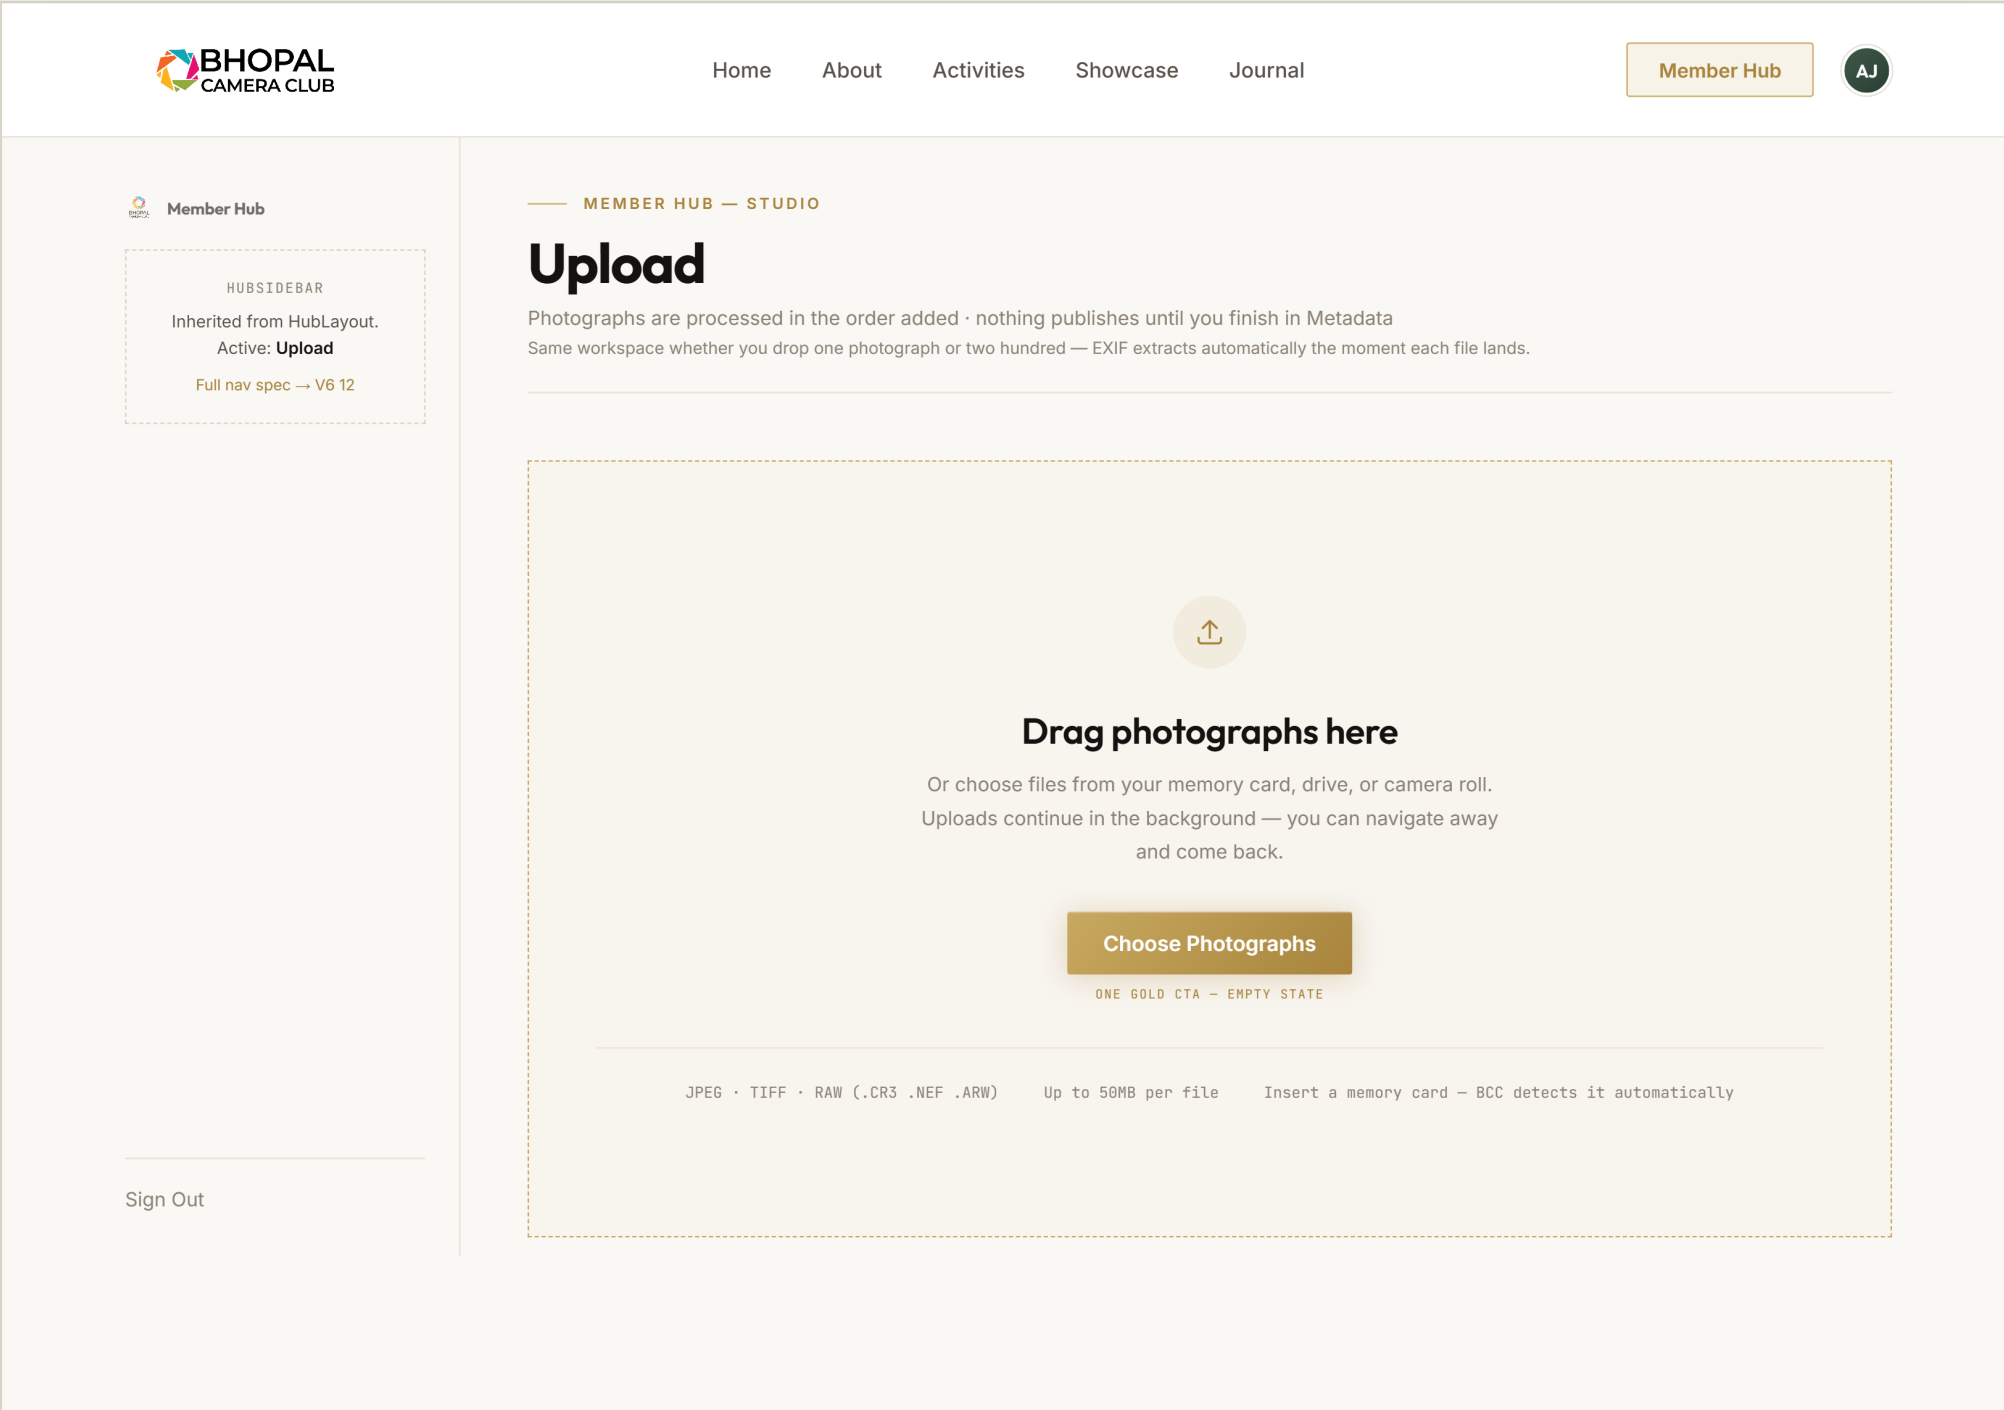
EXIF
Automatic on upload — never blocks

GOLD CTA
One only per state — never two competing actions

01 Desktop — Empty Upload Workspace

A single editorial drop zone — no toolbar, no queue chrome, no clutter. One gold CTA. The frame reads like an empty light table waiting for film, not a form waiting to be filled.

Upload — empty workspace EMPTY 1440 · shown at 50%



MEMBER HUB — STUDIO

Upload

Photographs are processed in the order added · nothing publishes until you finish in Metadata

Same workspace whether you drop one photograph or two hundred — EXIF extracts automatically the moment each file lands.

HUBSIDEBAR
Inherited from HubLayout.
Active: Upload
Full nav spec → V6 12

Drag photographs here

Or choose files from your memory card, drive, or camera roll. Uploads continue in the background — you can navigate away and come back.

Choose Photographs
ONE GOLD CTA — EMPTY STATE

JPEG · TIFF · RAW (.CR3 .NEF .ARW) Up to 50MB per file Insert a memory card — BCC detects it automatically

Page Header carries only the state's plain-language explainer — no counts, no clutter. Drop zone: full-width dashed gold frame, generous internal padding, single icon, single gold CTA. Supported formats and memory-card hint sit quietly below the fold, mono-set, never competing with the CTA. There is no separate single-file mode — this same drop zone is the entire Unified Upload Studio entry point, for one photograph or many.

02 Desktop — Upload Queue

Thumbnails first, status second. Each tile carries its own lifecycle independently — one failure never blocks the batch. Quiet status chips, not a progress table.

Upload — 12 photographs queued UPLOADING 1440 · shown at 50%

DSC_0350.CR3 Already uploaded — matches Jun 12 upload

Every tile is a photograph, never a table row. Lifecycle: Queued (55% opacity, no chip motion) → Uploading (gold progress ring over the dimmed thumbnail, % chip) → Processing (soft blur, quiet neutral chip) → Complete (✓ chip, full clarity) → Failed (isolated — rust outline, plain-language reason, per-tile Retry) → Duplicate Detected (tan outline, matched file reference, Replace / Keep Both / Skip). Duplicate detection, like EXIF extraction, is automatic and never blocks the rest of the batch from uploading. "Cancel remaining" is the only batch action; it never touches completed files.

03 Desktop — Metadata Workspace

Once uploads complete, photographs move here for captioning. Metadata lives in a contextual Inspector — never a dominant form. Selecting several photographs enables bulk fields, applied only to the selected set — the rest of the batch is untouched. Any field where selected photos already differ shows "Mixed" and asks before overwriting. Visibility, Copyright, and Licensing arrive pre-filled from the member's profile defaults; the photographer may override any of them per photograph or per selection.

Mixed

EXIF · DSC_0341 auto-extracted
Canon R6 RF 35mm ƒ/4 1/500s ISO 400 Jun 12, 6:42 AM *GPS unavailable*

Extracted immediately on upload. Missing fields (like GPS here) never block publishing.

Save as Draft Publish Now — 3 photographs
ONE GOLD CTA — METADATA STATE

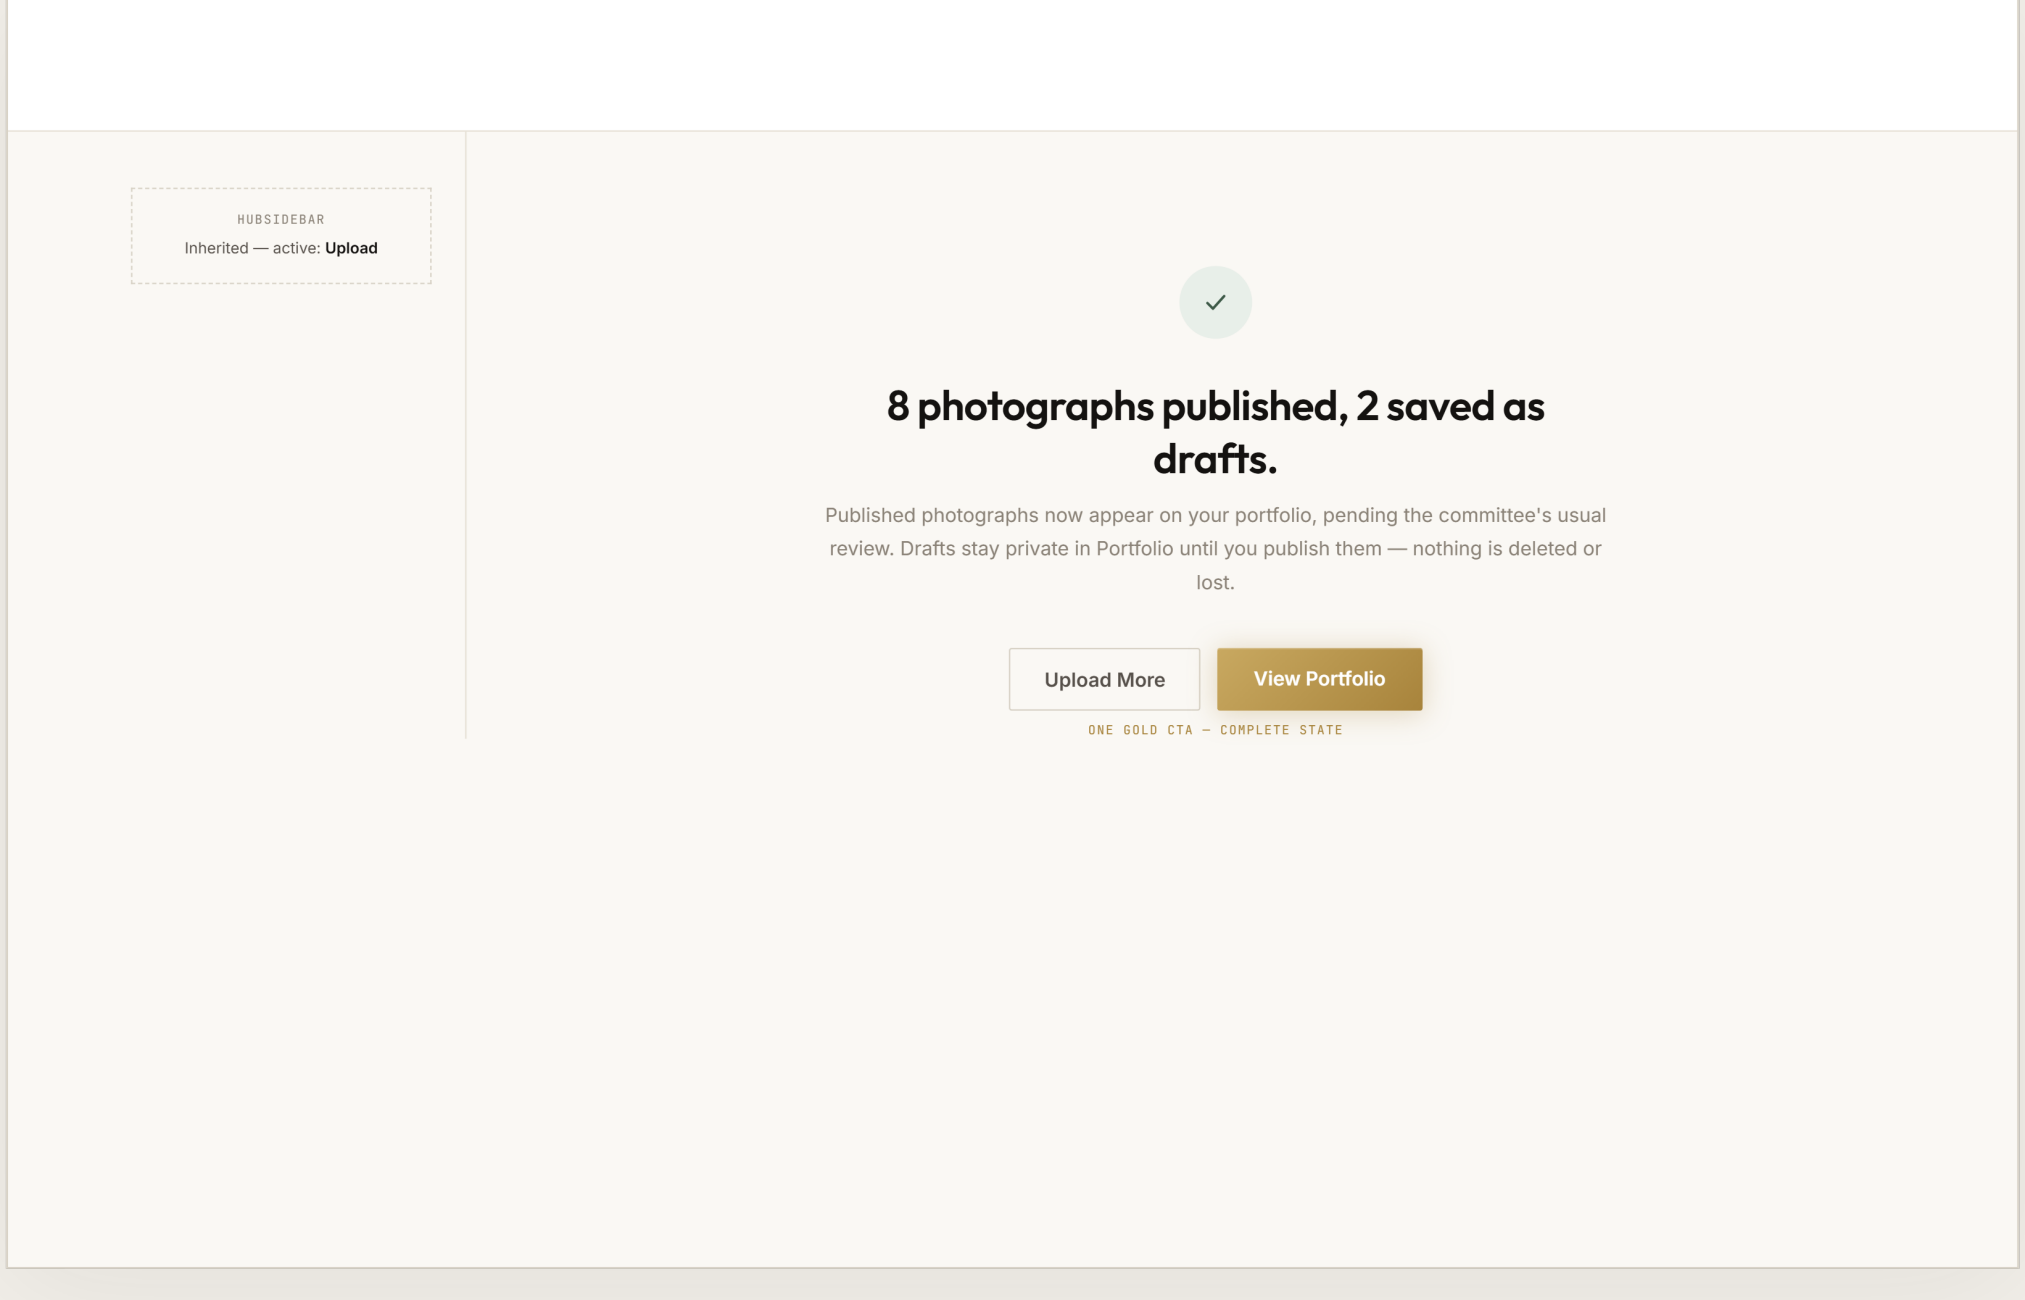
Draft photographs stay private until published — same Inspector, no separate draft screen

Bulk fields that already differ across the selection render as italic "Mixed" placeholders — typing into one requires an explicit click to confirm overwrite; nothing is silently replaced, and edits apply only to the selected photographs, never the whole upload. EXIF is always shown per-photograph (from the anchor image), auto-extracted on upload, never bulk-edited, and never required. Origin Activity is optional and, when set, applies to every photograph in the upload — later powering Showcase filtering, event galleries, and photographer statistics. Visibility, Copyright, and Licensing default from Member Profile preferences and can be overridden here. Title, Caption, Description, Genre, Keywords, Location, Copyright, Visibility, Featured, and Licensing all live here — never on the wall itself. The Inspector's final action is the Publication choice — Publish Now or Save as Draft — not a generic "Apply."

04 Desktop — Upload Complete

Quiet confirmation — a count, not a celebration. Reflects whatever Publication choice was made in the Inspector: published photographs go to the portfolio for review; drafts are counted separately and stay private. Two calm actions; only one is gold.

Upload — complete PUBLISHED 1440 · shown at 50%



HUBSIDEBAR
Inherited — active: Upload

8 photographs published, 2 saved as drafts.

Published photographs now appear on your portfolio, pending the committee's usual review. Drafts stay private in Portfolio until you publish them — nothing is deleted or lost.

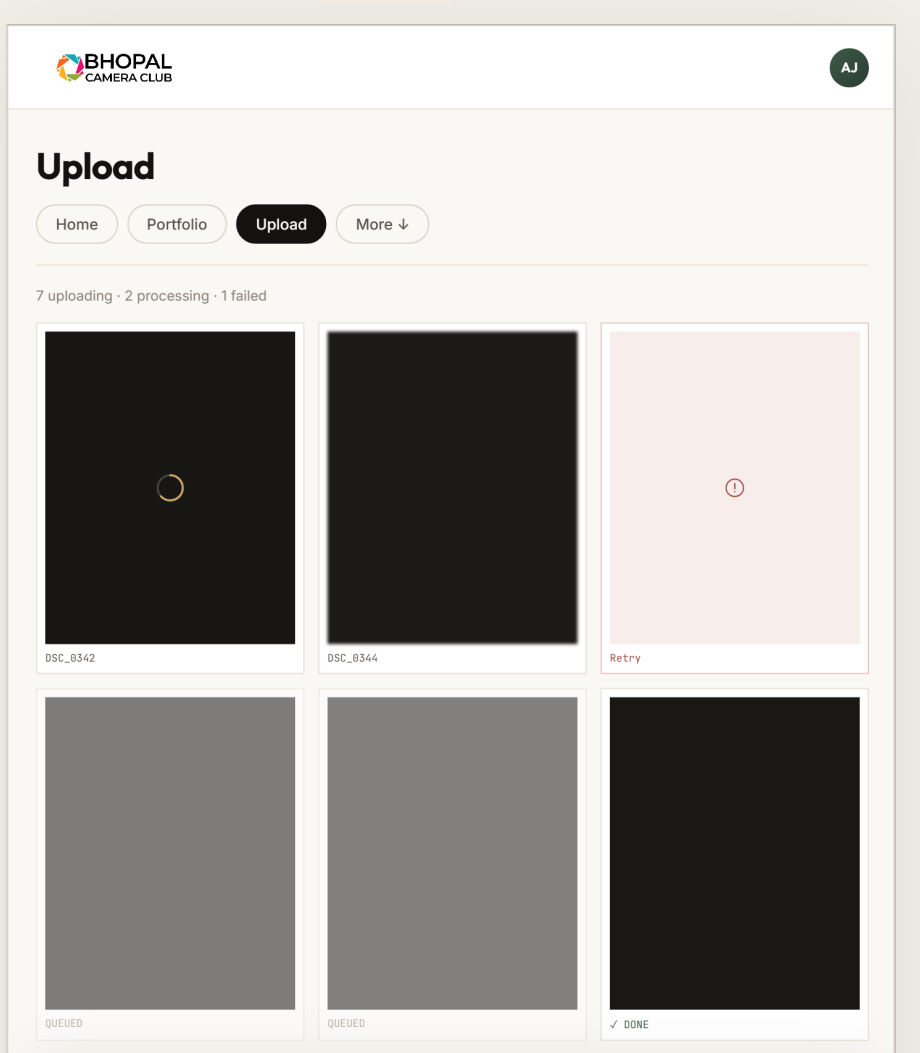
Upload More View Portfolio
ONE GOLD CTA — COMPLETE STATE

No confetti, no animated counters, no badge graphics. A single check mark, a plain sentence, and two actions — View Portfolio (gold, primary) and Upload More (quiet, secondary). The state reads as a full stop, not a reward screen.

05 Tablet — 641–1199px

HubTabs replace the rail. Queue runs 3-up. The Inspector becomes a bottom sheet rather than a right overlay.

Upload — tablet queue UPLOADING 768 · shown at 60%



Upload

7 uploading · 2 processing · 1 failed

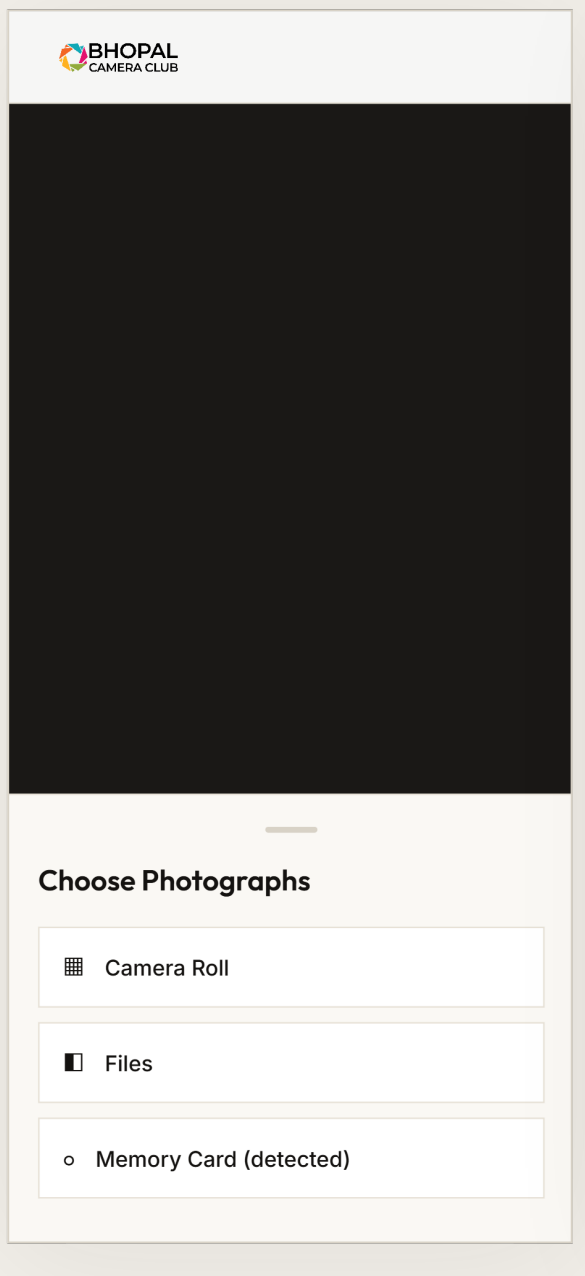
INSPECTOR — SHEET
Slides up over the queue once photographs finish processing.

641–1199px: HubTabs replace the rail. Queue runs 3-up, same tile lifecycle states as desktop. Inspector becomes a full-width bottom sheet rather than a right overlay — same fields, stacked single-column.

06 Mobile — ≤640px

HubMobileBar replaces the rail. Camera Roll-style source picker. Queue runs 2-up. Metadata and completion both open as bottom sheets with large touch targets.

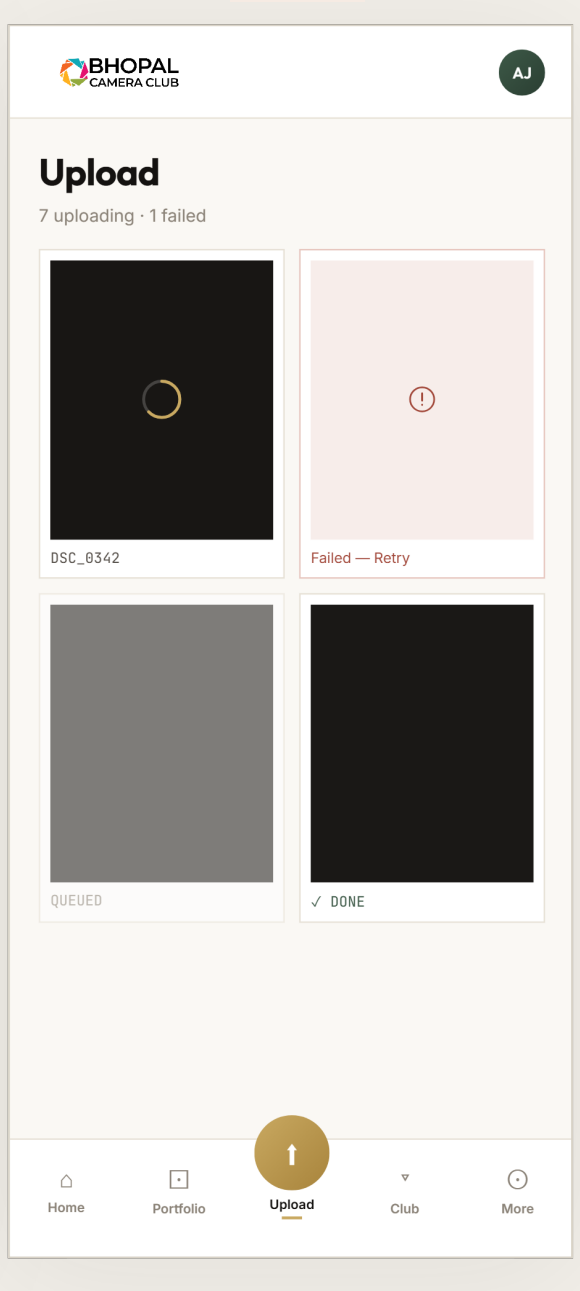
Mobile — source picker sheet 390 · 75%



Choose Photographs

Choosing "Choose Photographs" opens a bottom sheet with 56px rows — Camera Roll leads. Memory card option appears only when one is detected.

Mobile — queue UPLOADING 390 · 75%



Upload

7 uploading · 1 failed

≤640px: 2-col queue. Tapping a photograph opens metadata as a full-screen sheet, not an inline panel. Failed tiles isolate cleanly with a large Retry target. Uploads persist through navigation — leaving mid-batch never loses progress.

07 Specification

SECTION ANNOTATIONS

① **Drop Zone** — sole element of the empty state. Dashed gold frame, single icon, single CTA, quiet format hints. One photograph or many — same zone, same flow.

② **Upload Queue** — grid of photograph tiles, each carrying its own lifecycle, including automatic EXIF extraction and duplicate detection. No table, no rows.

③ **SelectionBar** — identical vocabulary to V6 10's Portfolio SelectionBar, repurposed for bulk metadata entry instead of batch ops. Applies only to the selected subset.

④ **Inspector Panel** — right-edge overlay on desktop, bottom sheet on tablet/mobile. Bulk fields show "Mixed" rather than silently overwriting. Carries Origin Activity, auto-extracted EXIF, profile-defaulted Visibility/Copyright/Licensing.

⑤ **Publication** — the UploadInspector's terminal action: Publish Now or Save as Draft, not a generic "Apply."

⑥ **Complete State** — plain sentence + split count (published / draft), two actions, one gold. No animation, no graphic.

⑦ **QueueToolbar** — appears only during active upload. Shows batch count, background-upload hint, and the single non-destructive batch action: Cancel Remaining. Never touches completed or failed tiles.

UPLOAD LIFECYCLE

Queued → visible, 55% opacity, no chip motion
Uploading → gold progress ring, % chip
Processing → soft blur, neutral chip
EXIF Extraction → automatic, silent, non-blocking
Duplicate Check → Already Uploaded → Replace / Keep Both / Skip
Complete → full clarity, ✓ chip
Failed → isolated, rust outline, plain-language reason, per-tile Retry

Uploads continue in the background on navigation. A failure, missing EXIF, or a detected duplicate never blocks or pauses sibling uploads.

DEFAULTS & INHERITANCE

Visibility ← Member Profile
Copyright ← Member Profile
Licensing ← Member Profile
Origin Activity ← manual, optional

All three profile defaults are overridable per photograph or per selection. Origin Activity, once set, cascades to every photograph in the upload — it feeds Showcase filtering, event galleries, photographer activity, and statistics.

INFORMATION HIERARCHY

1. Photograph thumbnails (always)
2. Lifecycle chip / progress ring
3. Gold CTA (one per state — state-appropriate action)
4. Selection state (gold ring + check)
5. SelectionBar / UploadInspector (contextual)
6. Page Header summary
7. Left rail (wayfinding)
8. Site header (public exit)

Metadata fields never render inline on the wall — always inside the Inspector, opened intentionally.

RESPONSIVE + CONDITIONAL

`≥1200 4–5-col queue · inspector overlay`
`641–1199 3-col queue · inspector sheet`
`≤640 2-col queue · sheet source picker`

Conditional rendering
Drop zone: renders only when queue is empty
SelectionBar: hidden at zero selection
Failed reason: renders only on failure
Duplicate actions: render only when a match is found, never blocking
Origin Activity: optional, no default selection
Memory-card row: renders only when detected

Auth gate
Owned by HubLayout — role ≥ member. Unauthenticated redirect → /auth/signin.

COMPONENT TREE

```
HubLayout (role ≥ member)
├ SiteHeader
├ HubSidebar — active: Upload · spec → V6 12
│  ├ HubRail [≥1200px]
│  ├ HubTabs [641–1199px]
│  └ HubMobileBar [≤640px]
└ HubMain
  ├ PageHeader — title · per-state summary
  ├ DropZone? — empty state only
  ├ QueueToolbar? — active upload only
  ├ UploadQueue?
  │  └ QueueTile ×n — per-file lifecycle
  ├ SelectionBar? — metadata phase only
  ├ UploadInspector? — right overlay · sheet on tablet/mobile
  │  ├ OriginActivitySelector?
  │  ├ ExifSummary — read-only · auto-extracted
  │  ├ DefaultsFromProfile — Visibility · Copyright · Licensing
  │  └ PublicationControl — Publish Now · Save as Draft
  ├ SourcePickerSheet? [≤640px · triggered by DropZone]
  └ CompleteState?
SiteFooter
```

? = conditional
DropZone renders only when the queue is empty. QueueToolbar renders during active upload. UploadQueue renders once files have been added. SelectionBar renders only when photographs are selected in the metadata phase. UploadInspector renders only when photographs are selected and all selected items have finished uploading. SourcePickerSheet renders on ≤640px when the member taps "Choose Photographs". CompleteState replaces the entire workspace once all queued items have resolved.

Component ownership
QueueTile owns its own lifecycle independently — uploading, processing, complete, failed, duplicate. One tile's failure never pauses or blocks its siblings.

Automatic, non-blocking
EXIF extraction and duplicate detection run per-file, immediately on upload. Neither can interrupt or fail the upload itself. Missing EXIF and unresolved duplicates are flagged for later attention, never before upload completes.

UploadInspector vs. Portfolio InspectorPanel
These are distinct components sharing a visual shell. UploadInspector handles bulk metadata entry across a selection — not single-photo editing. Mixed-value fields show "Mixed" rather than silently overwriting. Publication is its terminal action. Portfolio InspectorPanel (V6 10) handles single-photo editing, navigation, and focal-point setting.

SelectionBar variants
Upload SelectionBar: count + clear only — no batch-ops actions.
Portfolio SelectionBar (V6 10): Feature · Visibility · Move · Delete.
Visually identical shell; behaviourally distinct.

Auth gate
Owned by HubLayout — role ≥ member. Unauthenticated redirect → /auth/signin.
